GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: COMPUTATIONAL METHOD FOR IDENTIFYING ADHESIN AND ADHESIN-LIKE
TITLE OF INVENTION: PROTEINS OF THERAPEUTIC POTENTIAL
FILE REFERENCE: 30853/40359A
CURRENT APPLICATION NUMBER: US/11/052,554A
CURRENT FILING DATE: 2006-02-07
PRIOR APPLICATION NUMBER: US 60/589,227
PRIOR APPLICATION NUMBER: IN 173/DEL/2004
PRIOR FILING DATE: 2004-07-20
PRIOR FILING DATE: 2004-02-06
NUMBER OF EQ ID NOS: 763
SOFTWARE: Patentin Version 3.3

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

Claim 5; Page 8; 49pp; English.

The present sequence is the protein sequence of the glucan binding protein-B (GbpB) of Streptococcus mutans strain 3SN1. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibilty complex (WHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptide subunits of a glucosyltransferase. The antibody in a mammal. Dispitopic or multiplications production of an antibody in a mammal. Dispitopic or multiplication peptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in

~

```
New composition comprising a fragment of a glucan binding protein-B (GbpB) that binds to MHC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.
                                                                                                 The invention relates to a composition comprising a fragment of a gluca binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                             Score 2116; DB 9

The present sequence is the protein sequence of the glucan binding protein—B (GbpB) of Streptococcus mutans strain 15JP2. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibility complex (MHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, cowplently linked with peptide subunits of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multipitopic polypeptides can be prepared synthetically or by recombinant bNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            QVSALQTQQAELQAENQRLEAQSATLGQQIQTLSSKIVARNESLKQQARSAQKSNAATSY 120
                                                                                                                                                                                                         composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TIAONTNALNTOGAQLEAAQLNLGAELTTAQDQKATLVAQKAAAEEAARQAAAAQAAAEA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             composition comprising a fragment of a glucan binding protein-B bB) that binds to MHC class II protein, and a biocompatible oparticle, useful for producing an antibody (claimed) for immunizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammals against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9

The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibility complex (MRC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptides subunits of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or mutripatiopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                             Glucan binding protein-B; GbpB; vaccine; anticaries; epitope; immunogen.

The present sequence is the protein sequence of the glucan binding protein-B (GbpB) of Streptococcus mutans strain SK32. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibility complex (FHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptide subunits of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multipatiopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 MKKRILSAVLVSGVTLSSATTLSAVKADDFDAQIASQDSKINNLTAQQQAAQAQVNTIQG

dentifying adhesin and adhesin. The proteins, by computing the sequencebased attributes of protein sequences using five attribute modules of a
neural network software, training an artificial neural network (ANN) for
each of the computed five attributes, and identifying the adhesin and
adhesin-like proteins having probability of being an adhesin (Pad) as
equal or greater than 0.51. Also claimed is a set of 274 annotated genes
encoding adhesin and adhesin-like proteins, having 105 fully
genes encoding adhesin-like proteins, having 105 fully
cefined 306-15876 base pairs (SEQ ID NO: 659-763), a set of 279 annotated
adhesin and adhesin-like proteins, having 105 fully
conditions and adhesin-like proteins, having 105 fully
conditions and adhesin-like proteins, having 105 fully
sequences; a set of 279 annotated
adhesin and adhesin-like proteins, having 105 fully defined 53-3716 base
conditions, having 105 fully defined 106-5291 base pair (SEQ ID NO:
280-384) sequences; and a fully connected multilayer feed forward ANN (1)
based on (M1). (M1) is useful for identifying adhesin and adhesin-like
proteins for therapeutic potential, and identifying and short-listing
proteins for further testing in development of new vaccine formulations
to eliminate diseases caused by various pathogenic organisms. (M1) is Computational method for identifying adhesin and adhesin like molecules, comprises computing sequence-based attributes of protein sequences using neural network software and training an artificial neural network. present invention relates to a computational method (M1) for Claim 16; SEQ ID NO 210; 402pp; English 

Sequence 431 AA;

protein sequence.

useful for identifying putative adhesins that are important in drug discovery and preventing therapeutics for whooping cough, pneumonia, gastric ulcer and urinary tract infections. (M1) identifies adhesins from distantly related organisms, and from bacteria belonging to a wide phylogenetic spectrum. (M1) is capable of predicting adhesive nature of unique proteins. The present sequence is a microbial pathogen adhesin

(FORS-) FORSYTH INST.

Smith DJ, Taubman MA;

2003-845091/78. GENBANK; AY046414. Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.

Claim 5; Page 8-9; 49pp; English.

The present sequence is the protein sequence of the glucan binding protein-B (GbpB) of Streptococcus mutans strain 5SM3. The sequence includes a number of human leucocyte antigen (HLA)-binding epitopes. The invention provides immunogenic compositions and vaccines for dental caries. The compositions comprise major histocompatibity complex (MHC) class II protein-binding GbpB peptides, especially HLA-binding peptides, covalently linked with peptide subunits of a glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiplicytopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a composition comprising a fragment of a glucan binding protein-B (GbpB) and a biocompatible microparticle, where the fragment binds to a major histocompatibility complex (MHC) class II protein. The composition is useful for producing an antibody for immunizing mammala against dental caries. This sequence corresponds to a Streptococcus mutans GbpB protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising a fragment of a glucan binding protein-B (GDBB) that binds to MfC class II protein, and a biocompatible microparticle, useful for producing an antibody (claimed) for immunizing mammals against dental caries.

etreptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus antibacterial and antiinflammatory activity. (1), nucleic acids encoding (1), ABN66044-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (1) are used to determine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be used as a vaccine or disagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy, Antibodies to (1) are used for affinity when the composition when the composition are used for affinity the disease caused by the used in gene therapy. Antibodies to (1) are used for affinity and may be the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of the distribution of
invention relates to a protein (ABP25413-ABP30895) from group B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 447 AA;

vector; a hyperimmune serum-reactive antigen comprising the vector; a hyperimmune serum-reactive antigens of vector; a hyperimmune serum-reactive antigens of consisting of e.g., 85, 299, 467 cor 812 amino acids; fragments of hyperimmune serum-reactive antigens antigens of process for producing a Streptococcus agalactiae hyperimmune serum cactive antigens. A process for producing a cell that expresses a S. agalactiae hyperimmune serum reactive antigen; a process for producing a cell that expresses a S. agalactiae hyperimmune serum reactive antigen; a pharmaceutical composition, especially a vaccine, comprising the hyperimmune serum-reactive antigen; a mutaleic acid molecule; an antibody that binds at creative antigen or nucleic acid molecule; an antibody that binds at cleast to a selective part of the hyperimmune serum-reactive antigen; a method for identifying an antigonist that binds to the hyperimmune serum-reactive antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an antigen; a method for identifying an interactive antigen; and a process for in vitro diagnosing a disease related to expression of the hyperimmune serum reactive antigen; and a process for in vitro diagnosing of the hyperimmune serum reactive antigen; and a process for in vitro diagnosing a disease related for isolating, purifying and/or identifying an interaction partner of the hyperimmune serum creactive antigen; and/or identifying to the hyperimmune serum reactive antigen is useful for isolating of the hyperimmune serum creactive antigen; or the hyperimmune serum reactive antigen; or the hyper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes an isolated nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment. Also described are: a vector comprising the nucleic acid molecule; a host cell comprising the

                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid molecule encoding a hyperimmune serum reactive antigen, useful for the manufacture of a vaccine against Streptococcus agalactiae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              functional nucleic acid comprising aptamers or spiegelmers. The nucleic acid molecule is useful for the manufacture of a functional ribonucleic acid comprising ribozymes, antisense nucleic acids or siRNA. The nucleic acid molecule, hyperimmune serum-reactive antigen or antibody is useful for the manufacture of a vaccine against S. agalactiae infection. This is the amino acid sequence of a Streptococcus agalactiae hyperimmune serum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MKKRILSAVLVSGVTLSSATTLSAVKADDFDAQIASQDSKINNLTAQQQAAQAQVNTIQG

The nucleotide sequences encode polypeptides of sagalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleotides, regulatory functions, replication, translation, protein transport, adaptation to atypical conditions, sensitivity to medicilnes and/or analoques, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are pharmaceutical composition and/or amilification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactiae infection. ```

```
The present invention relates to novel Streptococcus agalactiae
nucleotide sequences (I; ADV78860-ADV78998 and ADV83341-ADV85476) and
novel polypeptides (II; ADV78999-ADV81205-ADV83340). The
nucleotide sequences encode polypeptides of S. agalactiae involved in the
nucleotide sequences encode polypeptides of S. agalactiae involved in the
synthesis of amino acids, cell membranes, intermediate (central)
cetabolism, energetic metabolism, fatty acid and phospholipid metabolism,
nucleotide metabolism including purinnes, pyrimidines and/or nucleosides,
regulatory functions, replication, transcription, translation, protein
regulatory functions related to transposons, biosynthesis of
and/or analogues, functions related to transposons, biosynthesis of
cofactors, prosthetic groups and transposters, cell membrane proteins and
cellular machinery. (I) are useful for the detection and/or amplification
of nucleic acids. Pharmaceutical composition comprising (I) or [II] are
useful for treatment of a bacterial S. agalactiae infection. The complete
genome of Streptococcus agalactiae is given in ADV81204. Note: The
present patent is an equivalent for the basic patent FR2824074Al, which
contains only 2344 sequences.
Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                        Claim 6; SEQ ID NO 2949; 439pp; French.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
